

Top five fragments identified from each site. The order of the sites are the same as in Fig 5. The top five fragments of a site are not necessarily visually similar to each other because the feature associated with each fragment is actually represented in 4 orientation and 3 color space. Even so, for some sites such as S3_a4, S1_f, S3_a1, and S3_b4, we can find some similarity across fragments.
